# Topics: Descriptive Statistics and Probability

1. Look at the data given below. Plot the data, find the outliers and find out μ, σ, σ^2

| Name of company	Measure X
Allied Signal	24.23%
Bankers Trust	25.53%
General Mills	25.41%
ITT Industries	24.14%
J.P.Morgan & Co.	29.62%
Lehman Brothers	28.25%
Marriott	25.81%
MCI	24.39%
Merrill Lynch	40.26%
Microsoft	32.95%
Morgan Stanley	91.36%
Sun Microsystems	25.99%
Travelers	39.42%
US Airways	26.71%
Warner-Lambert	35.00%

Sol :-
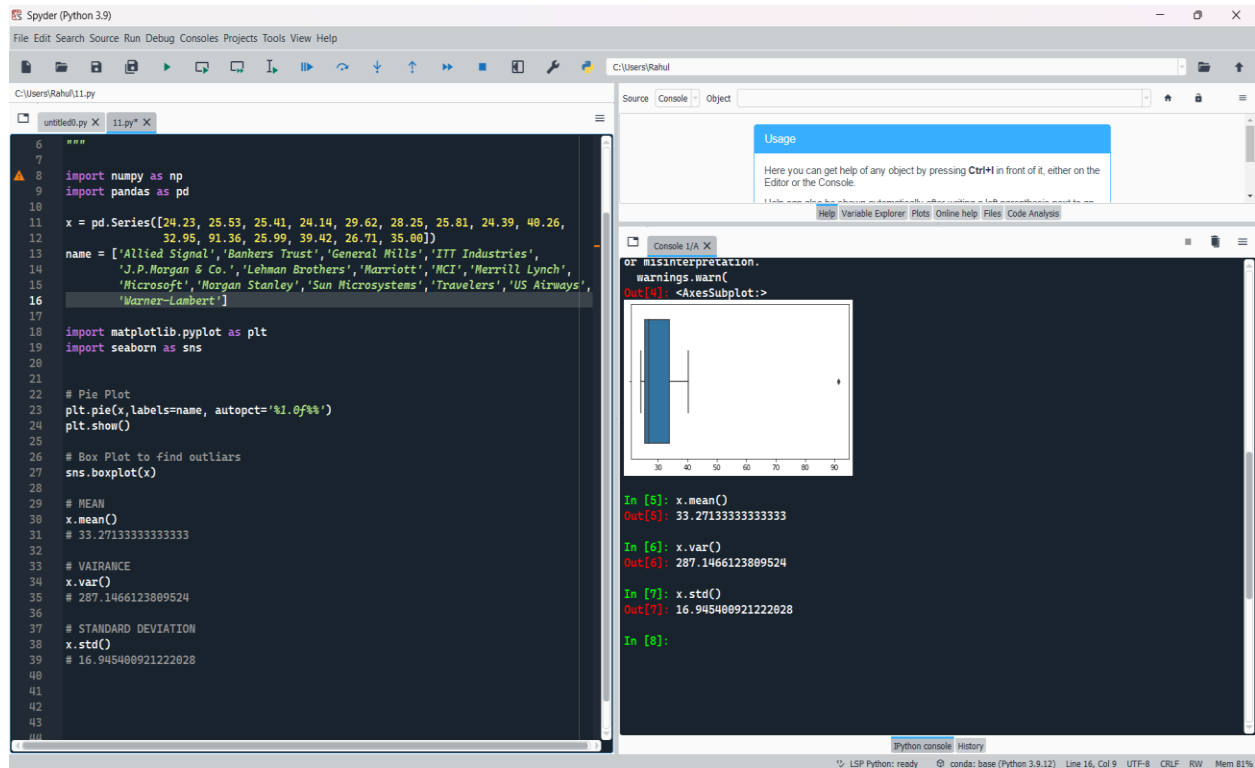

Pie plot is plotted using above data
Outliers are found towards the right side of the data.
Mean, Variance and Standard Deviation are found

2.

Box-Plot of variable 'X'

Answer the following three questions based on the box-plot above.

(i)   What is inter-quartile range of this dataset? (please approximate the numbers) In one line, explain what this value implies.

Sol:- Approximately

1st Quantile Range Q1 = 5

3rd Quantile Range Q3 = 12

2nd Quantile Range Q2 = 7

Inter Quartile Range IQR = Q3-Q1

12 – 5 = 7

Then the 2nd Quartile range is the Median Value.

(ii)   What can we say about the skewness of this dataset?

Sol:- Right-Skewed median is towards the left side it is not Normal Distribution.

(iii)   If it was found that the data point with the value 25 is actually 2.5, how would the new box-plot be affected?

Sol:-   In that case there would be no Outliers on the given dataset because of the outlier the data had positive skewness it will reduce and the data will normal distributed.

3.
Answer the following three questions based on the histogram above.

(i)   Where would the mode of this dataset lie?

Sol:-   The Dataset Mode is Lie between 5 to 10 and Approximately in between 4 to 8.

(ii)   Comment on the skewness of the dataset.

Sol:-   The Histogram data is a Right Skewed Data.
It is in Mean>Median>Mode.

(iii)   Suppose that the above histogram and the box-plot in question 2 are plotted for the same dataset. Explain how these graphs complement each other in providing information about any dataset.

Sol:-   The data of the following are Right skewed and the both have outliers the median can be easily visualized in box plot where as in the histogram mode is more visible.

4. AT&T was running commercials in 1990 aimed at luring back customers who had switched to one of the other long-distance phone service providers. One such commercial shows a businessman trying to reach Phoenix and mistakenly getting Fiji, where a half-naked native on a beach responds incomprehensibly in Polynesian. When asked about this advertisement, AT&T admitted that the portrayed incident did not actually take place but added that this was an enactment of something that "could happen." Suppose that one in 200 long-distance telephone calls is misdirected. What is the probability that at least one in five attempted telephone calls reaches the wrong number? (Assume independence of attempts.)

Sol:-

The total number of telephone calls = 200

The Probability of the event $P(E) = \dfrac{1}{200}$

Therefore,

$P(e) = 1 - P(E)$

$= 1 - \dfrac{1}{200} = \dfrac{199}{200}$

Probability that at least one in 8 attempted call reaches the wrong number

= 1 – Probability of no. of attempted call reaches the Wrong Number

$= 1 - (\dfrac{199}{200} \times \dfrac{199}{200} \times \dfrac{199}{200} \times \dfrac{199}{200} \times \dfrac{199}{200} \times \dfrac{199}{200} \times \dfrac{199}{200} \times \dfrac{199}{200})$

$= 1 - (\dfrac{199}{200})^{\wedge}8$

$= 1 - 0.9606$

$= 0.0393$

Probability that at least one in eight attempted telephone calls reaches the wrong number = 0.0393

5. Returns on a certain business venture, to the nearest $1,000, are known to follow the following probability distribution

x	P(x)
-2,000	0.1
-1,000	0.1
0	0.2
1000	0.2

2000	0.3
3000	0.1

E(X) =Sum X.*P(X)*

*E(X^2) =X^2*P(X) Total: 800

(i)   What is the most likely monetary outcome of the business venture?

Sol:- The Most likely monetary outcome of the business venture is 2000$,
As for 2000$ probability is 0.3 which is maximum as compared to
others.

(ii)   Is the venture likely to be successful? Explain

Sol:- The venture will make more than 0 or profit

= P (X>0) + P (X>1000) + P (X>2000) + P (X=3000)

= 0.2 + 0.2 + 0.3 + 0.1

= 0.8

It stats that 80% chances for making the venture to be profit.

(iii)   What is the long-term average earning of business ventures of this
kind? Explain

Sol:- The long-term average is Expected value = Sum (X * P(X)) = 800$
which means on an average the returns will be + 800$

(iv)   What is the good measure of the risk involved in a venture of this
kind? Compute this measure

Sol:- The good measure of the risk involved in a venture of this kind
depends on the Variability in the distribution.

Higher Variance means more chances of risk Var

(X) = E(X^2) –(E(X))^2

= 2800000 – 800^2

= 2160000
